Uhm... many people like beer.

Not all of them know that this drink's alcoholic fermentation is made by a yeast called "Beer yeast" or **saccharomyces cerevisiae** (and doubles itself to work... also to make bread, not only beer).

And they neither know that this yeast isn't really sociable (obvious, it works for two all the day...) like otherwise a kitten¹ could be.

So the **PGB Genetics Laboratoires** are proud to present their biotechnological product: from the coupling of yeast and a kitten, here is the **SACCAROMICIO**, a sociable yeast!

The only cons are that it is always drunk, scratches and leaves around its pee and poo...

--*--

1. In Italian "micio" is a kitten. And sounds like the Latin "myces" (of the **saccharomyces**)

P.s.: in italian the word Saccaromicio sounds like SaccharoKitten and is near to Saccharomyces
